ABSTRACT OF PERSONAL INFORMATION SYSTEM

The purpose of this project is to create a new application “PERSONAL INFORMATION SYSTEM”. It is used to maintain personal information which includes managing personal details, maintaining attendance, maintaining marks, internals and generating reports. We can easily add, modify, update or delete the information whenever required. The tedious job of managing attendance can be easily performed using the system and regular class time table can also be preserved in the database.

OBJECTIVE

Personal Information System is developed to efficiently maintain information of students which is currently done using files and records. Information maintenance includes maintaining student's personal details, attendance, periodic marks, university marks. Present system of information maintenance consumes huge amount of time and demands lot of man power since every activity must be done manually. In order to make maintenance more time efficient and to reduce manpower involved we develop Personal Information System.

INTRODUCTION

Personal Information System is software which is helpful for students as well as the school authorities. In the current system all the activities are done manually. It is very time consuming and costly. Our personal information system deals with the various activities related to the students. There are mainly 3 modules in the software :-

1. Administrator Module
2. Faculty Module
3. Student Module

1.1. PURPOSE:

The objective of student information system is to allow the administrator of any organization edit and find out the personal details of a student and allows the student to keep up to date his profile. It will also facilitate keeping all the records of students, such as their id, name, address, DOB etc. So all the information about an student will be available in a few seconds. Personal Information System and is intended to help any organization to maintain and manage its student's personal data.

1.2. SCOPE :

Without a Personal Information System, managing and maintaining the details of the student is a tedious job for any organization.

Personal Information System will store all the personal details including their background information, educational qualifications, personal details and all the information related to their resume.

LITERATURE SURVEY

2.1 Personal Management System based on .Net Three-layer Structure: Personal Information Management system has been implemented by (Yang Qingshan, 2010) using .Net Architecture for better standardization, information management, and three layer B/S structure. This architecture improves the security and maintainability.

2.2 Design and implementation of Student Information Management System: Similarly simplified friendly interface student management system has been designed and implemented with the use of Visual Basic 6.0 and the SQL Server 2000. This design has a fully functional, flexible and convenient application which provides friendly interface to the users (Zhibing Liu, 2010).

2.3 Personal Information Access System via Bluetooth: K.A.C. Dushamali (2007) also presented their work and concluded the information can be accessed by teachers and students using Bluetooth. The system consist of a J2SE Server.

2.4 A Project Report on Personal Information Management System: Kapil Kaushik (2011) also built a student information management system with features like online registration of students, maintenance of students records and searching student records. Their system was built using HTML, JavaScript implementing PHP, MySQL (as back end). They also used Apache HTTP server and Dreamweaver (Kapil Kaushik, 2011).

2.5 Web Based Personal Information Management System (SIMS) : S.R.Bharamagoudar, Geeta R.B and S.G.Totad also have built SIMS for maintenance of Personal information system solving the traditional way of managing the student records. The system was built using html, PHP and MySQL database.

PROBLEM STATEMENT AND PROPOSED SOLUTION

CONCLUSION & FUTURE SCOPE

This Personal Information system project will serve as a useful approach to data base dialog box to update add, advanced search options for the authorized person. It serves as a helpful approach for the users. It reduces the time taken by the user to add, update, delete, view & search the information. Thus the project is the user friendly approach. The “Personal Information System” application is built on the case study of NIET ,Greater Noida after analyzing the requirements at its premises pertaining to adding student information, updating student information, deleting student information, and viewing student information. It also provides with advanced search facilities and facilities to create authorised users with passwords and also for changing their passwords at some later stage.

FUTURE PERSPECTIVE: Everything has its own scope of modification and improvement. In this project we will add more modules that support extra information & search facilities. Regarding internal organisation of the project we will improve its security features using advance technologies so that unauthorized user can't breaks the integrity and authenticity. Illegal access will be prevented and strictly prohibited. Further we will improve upon validation code. Each record and entries will be properly validated before storing in database .
